

Sectoral, Style and Market Cap Leadership Keep Rotating

The key phenomenon of our industry is that the best performing fund/fund house/manager or sector/market cap/style is rotating in about 18 to 24 months. Following are some past instances of the challenges one faced with a style or theme bias investment approach.

Value Style Under-Performed for 3 Years

Before the comeback in CY 2021, for **three consecutive calendar years (2018, 2019, 2020)**, Value Style underperformed most of the other styles of fund management. Delivering poor investor experience.

Roller-Coaster Ride with Quality Style

Quality Style **worked well in CY 2018 and CY 2020** but did poorly in CY 2017 and CY 2019.

Domestic v/s Export Oriented Theme

Sectors like IT Services and Pharma were among the **worst performing sectors in CY 2016 and 2017** compared to broader market. Subsequently, **IT Services outperformed** most of the other sectors in **CY 2018, 2020 and 2021**, and Pharma outperformed in 2020.

Defensives v/s Cyclical

Some of the **Defensive Sectors did well in CY 2020** but in **CY 2021** many of the Cyclical Sectors performed relatively better than broader market and **Defensive Sectors were among the laggards**.

It is not possible to consistently time the winners and there may be prolonged cycle of outperformance and underperformance. Following or Skewness to a particular style may increase portfolio volatility and can adversely impact portfolio performance on risk adjusted basis.

Why Do Winners Rotate?

In the following illustration, we have categorized S&P BSE 500 and WhiteOak Portfolio in terms of various factors. For example, 77.1% of S&P BSE 500 is composed of large cap stocks and 22.9% is composed of SMIDs (Small and Mid Caps).

Expressing S&P BSE 500 and White Oak Portfolio by Factors (In terms of weight %)

Factors as per MSCI Barra Risk Model; Factor disaggregation for illustration purposes only. These factors may not be mutually exclusive. Past performance may or may not sustain in future. White Oak Portfolio : White Oak India Pioneers Equity PMS as of June 30, 2023

The WhiteOak portfolios are quite extensive. Our endeavor is to construct a balanced portfolio in relation to the S&P BSE 500 index. This involves incorporating certain aspects of the S&P BSE 500 while primarily emphasizing superior stock selection. Although our portfolio may consist of 70-80 stocks, our primary goal is to outperform the benchmark. This pursuit necessitates a high level of active share.

As a result, we refrain from implementing any filters or screeners at the initial stage. Instead, we commence with the entire spectrum of investment options and subsequently strive to attain an equilibrium within the portfolio concerning style, sector, and market capitalization. Within this framework, we identify the most promising stocks for investment, forming the basis of our portfolio construction strategy. We intend to cultivate comprehensive portfolios that minimize market fluctuations and ensure greater consistency of alpha.

Over time, the macroeconomic landscape undergoes changes. Different macroeconomic conditions exert varied impacts on distinct sectors and companies. Consequently, any chosen style, sector, or market capitalization strategy will be subject to alteration as macros evolve.

While a manager might opt for a specific style, favoured sectors, or thematic considerations, this inadvertently confines their focus to a narrower market segment. During periods when this segment is favoured, it may result in substantial outperformance. However, a shift in market sentiment can lead to significant underperformance, causing a fund that previously lagged to surge ahead.

The rotation of winners stems from the fact that investment managers tend to adopt distinctive styles. Given the fluctuating nature of macroeconomic conditions, preferences for style, sector, and market capitalization tend to oscillate, resulting in a rotation of winners.

The chart above illustrates the representation of the S&P BSE 500 across various factors. Active management is imperative for alpha generation. Outperforming the market necessitates a departure from a passive approach, entailing a significant active share.

Why Do Winners Rotate?

Factor Diversified Balanced Portfolio with High Active Share

The pre-requisite for any manager to generate alpha or outperform the benchmark is to have an active share. Active Share is the measure of the percentage of security holdings in a manager's portfolio that differs from the benchmark. A low Active Share score indicates that a portfolio manager is closely replicating the Benchmark (engaging in a passive investment strategy). A high Active Share score suggests that a portfolio's holdings diverge from the benchmark. As a result, managers with reasonably high Active Share have a higher potential to outperform the benchmark.

Active positions can be attained either by taking top-down bets or via bottom-up stock selection. A top-down bet entails concentrated exposure along various factors such as growth/value, large/small & mid, defensives/cyclicals, exporters/domestic, etc. Factor performance inherently tends to be volatile and thus the performance of such a portfolio will also be volatile and is likely to swing between extremes.

However, higher active weights generated through bottom-up stock selection is likely to ensure that not only is the alpha generation strong but also consistent and not overwhelmed by factor performance over any reasonable time-period. This has been the case with WhiteOak's portfolio which has generated peer group leading performance since its inception with lower risk. However, as a caveat, we might choose to tolerate some of these factor risks but only if such risks are more than commensurately compensated by the increased potential for superior stock selection returns.

	Pure Indexing	Factor Neutral	Factor diversified (Balanced Portfolio)	Concentrated Factor bets	Concentrated Stock Picker
Description	Portfolio similar to Benchmark	No Active Factor Bets	Bottom-Up Stock Picking and a Balanced Portfolio Construction Approach	Targeted factor bets along Growth / Value, Large / SMID, Quality / Momentum, Thematic etc	Targeted individual stock bets
Active Risk (Volatility of Alpha)	Zero	Low	Medium	High	Highest
Active Share (Measure of the percentage of security holdings in a portfolio that differs from the benchmark)	Zero	Low	High	High	Highest

A higher active share may also introduce active risk, if the portfolio is constructed based on a narrow strategy such as concentrated top-down factor bets. Conversely, a manager can pursue a higher Active Share without necessarily increasing active risk by following a Balanced Portfolio Construction Approach.

How WhiteOak's approach to create Active Share is different?
